"Experimental Studies of the Effect of Urea on the Blood Sugar Level (Preliminary Report)."

Sofia, Eksperimentalna Meditsina i Morfologiya, Vol 2, No 1, April-May-June 1963, pp 30-34.

Abstract: [Authors' English summary modified] The authors report their studies of the effect of urea administered intravenously and orally to 25 rabbits. The blood sugar level declined from nine to 39 mg% in three-fourths of these animals, the extent of the reduction being in direct relation to the urea dosage. The urea had a paradoxical effect on rabbits with a comparatively low initial level of blood sugar, stimulating an increase. The blood sugar level declined an average of 18 mg% in rabbits treated with alloxan.

"Physiological Factors in Psychotherapy."

Prague, Activitas Nervosa Superior, Vol 5, No 4, 1963, pp 401 - 403

Abstract: Psychotherapy comprises complex physiological stimulations with many mechanisms involved. The presence of the physician plays an important role. Supportive therapies aim at suppression of neurotic complexes; psychoanalytic therapies produce overstimulation, which in successful cases leads to reintegration, and in unsuccessful ones may result in psychotic breakdowns. In schizophrenic cases schizokinetic pathology is little affected by individual or group therapy. Good effects are often achieved in paranoid schizophrenics, where the general disturbances of higher nervous activity are slight, but influences of pathodynamic structures strong. Combination of drugs and psychotherapy is advantageous for modifying pathodynamic structures. 9 Western, 3 Russian references. Submitted at the Medical Congress in Prague, November 1962.

Title : On the Standardization of Silage from Corncocks in the Rations of Hens

Orig Pub : Byul. nauchno-tekhn. inform. Arm. n.-i. in-ta zhivotnovodstva in veterinarii, 1957, No 1, 20-22

Abstract : It was noted that feeding 40 g of silage daily, per head, during 2½ months to hens weighing 1.2 kg had an adverse effect on their egg production. The author assumes that the harmful influence of such a quantity of silage was caused by a considerable content of organic acids in the silage. It is recommended to include in the rations of

2009. CHRYSANOL TREATMENT FOR LUPUS ERYTHEMATOSUS (Russian text)
- Aisaturova L. A. Med. Inst., Tashkent - From the symposium:
VOPR. DERM. I VENER. (Tashkent) 1957, 5 (177-180)
Thirty-five patients with lupus erythematosus (subacute form in 4 cases, acute form in 31 cases) were treated with intramuscular injections of chrysanol (oily suspension of calcium aurothiopropanolsulphonate, containing 35% gold). The treatment was administered as follows: 10 injections of a 5% solution, followed by 10 injections of a 10% solution and concluded with 5 injections of a 15% solution of the preparation. One ml. of the solution was used for each injection. The course of treatments lasted 2.5 to 4 months, depending upon the degree of the patients' tolerance. Clinical recovery was observed in 10 cases (2 with subacute forms), considerable improvement in 10 cases and some improvement in 5 cases. The chrysanol treatment had to be interrupted in 7 cases because of arising complications (prolonged profuse uterine bleeding, exacerbation of chronic adnexitis, urticaria, temperature reactions, nephropathy, dermatitis, exacerbation of lupus erythematosus). Two of the 10 cases of recovery had a relapse within one year after the completion of the treatment.

ture of Burlap.

Orig Pub : Prace Centr. inst. ochrony pracy, 1957, 7, No 2, 41-52

Abstract : The description and the results of the investigation are
given, concerning various emulsions for lubricating bast
fibers used in burlap manufacture. The best results
were obtained with emulsion "3" containing 1% solution
of rosin oil and petoil aqueous emulsion of mineral oils
(75% of soap and 25% of petoil).

 TITLE : The Effect of Agrotechnical Measures on the Flow
 of Gum in Tragacanth Mil Vetch of Armenia.
 ORIG. PUB. : Izv. AN ArmSSR. Biol. i s.-kh. n., 1957. 10, No.9, 3-12
 ABSTRACT : Experiments conducted during recent years in a number of
 regions of Armenia, showed that loosening the soil to 10
 centimeters with the subsequent maintenance of the sur-
 face in a clean and friable state, contribute to the in-
 tensification of erosion processes without affecting the
 flow of gum. In 1952, weekly irrigation at the rate of
 about 25 liters per clump had no effect on the yield at
 Sevenskiy Station and produced a negative effect at
